Bug Report — Manual Testing

Post-Booking Lifecycle Management

HEAL-238 — Cancelled slot does not revert to "Available" and blocks re-booking with "Already booked" error

Steps to Reproduce	Book any appointment time slot with a doctor. Go to My bookings and successfully cancel that appointment. Return to the doctor's profile page and select the exact same cancelled time slot. Proceed to checkout and click "Confirm appointment".
Expected Result	Cancelled slot automatically reverts to "Available" in the schedule and allows any patient to book it successfully.
Actual Result	The slot state remains blocked as "Booked", preventing re-booking and triggering the error banner: "This slot has just been booked. Please choose another time."
Priority / Severity	High High

HEAL-237 — Cancel booking button remains active and allows cancellation for appointments within 24 hours or less (missing restriction & tooltip)

Steps to Reproduce	Book any appointment scheduled within the next 24 hours (e.g., booked on Sep 11 for Sep 12 at 09:00 AM). Navigate to My bookings dashboard under the Upcoming section. Inspect the "Cancel booking" button and attempt to click it.
Expected Result	The "Cancel booking" button must be disabled for any appointment within 24 hours or less ($\leq 24h$). Hovering over the disabled button should show tooltip: "Cancellations are only allowed up to 24 hours before the appointment."
Actual Result	The button is clickable and active, allowing the patient to cancel an appointment scheduled in less than 24 hours without displaying the required tooltip.

Authentication & Access Control

HEAL-236 — User credentials (passwords) are stored as exposed plain text in localStorage under carenest_users

Steps to Reproduce	Open the application and log in or inspect existing registered accounts. Open Browser Developer Tools (F12). Navigate to Application → Storage → Local storage → select the domain URL. Locate the carenest_users key and inspect its JSON string value.
Expected Result	Passwords must never be stored as plain text on the client side (they should either be hashed, handled strictly via secure session tokens, or stripped from local storage entities).
Actual Result	The password field is stored as exposed, unencrypted plain text ("password":"patient123").
Priority / Severity	High High

HEAL-235 — Missing client-side required field validation on empty mandatory inputs (Email/Phone & Password) in Login form

Steps to Reproduce	Case A: Leave Email/Phone empty, fill Password -> Click Sign in. Case B: Fill Email/Phone, leave Password empty -> Click Sign in. Case C: Leave both fields empty -> Click Sign in.
Expected Result	Each empty mandatory field should be flagged inline (e.g., highlighted in red / showing "This field is required"), and form submission should be halted on the client side.
Actual Result	In all cases, no inline field flagging or required errors appear; the application directly displays the generic error "Invalid email/phone or password." below the button.
